

Memory FeRAM

1M (128 K × 8) Bit I²C

MS85RC1MTY

■ DESCRIPTION

The MS85RC1MTY is an FeRAM (Ferroelectric Random Access Memory) chip in a configuration of 131,072 words × 8 bits, using the ferroelectric process and silicon gate CMOS process technologies for forming the nonvolatile memory cells.

Unlike SRAM, the MS85RC1MTY is able to retain data without using a data backup battery.

The read/write endurance of the nonvolatile memory cells used for the MS85RC1MTY has improved to be at least 10¹³ cycles, significantly outperforming other nonvolatile memory products in the number.

The MS85RC1MTY does not need a polling sequence after writing to the memory such as the case of Flash memory or E²PROM.

■ FEATURES

- Bit configuration : 131,072 words × 8 bits
- Two-wire serial interface : Fully controllable by two ports: serial clock (SCL) and serial data (SDA).
- Operating frequency : 3.4 MHz (Max @HIGH SPEED MODE)
1 MHz (Max @FAST MODE PLUS)
- Read/write endurance : 10¹³ times (+ 125 °C)
10¹⁴ times (+ 85 °C)
- Data retention : 70.4 years (+ 85 °C),
19.1 years (+ 105 °C),
5.9 years (+ 125 °C)
- Operating power supply voltage: 1.8 V to 3.6 V
- Low-power consumption : Operating power supply current 0.24mA (Typ @3.4 MHz)
0.4 mA (Max @3.4 MHz)
Standby current 12μA (Typ), 150μA (Max)
Sleep current 0.3μA (Typ), 16μA (Max)
- Operation ambient temperature range : - 40 °C to + 125 °C
- Package : 8-pin plastic SOP (150mil)
8-pin plastic DFN (5mm × 6mm)
RoHS compliant

Fujitsu Semiconductor Memory Solutions Limited has changed its name to RAMXEED Limited. RAMXEED Limited will continue to offer and support existing products while maintaining Fujitsu's part number unchanged.

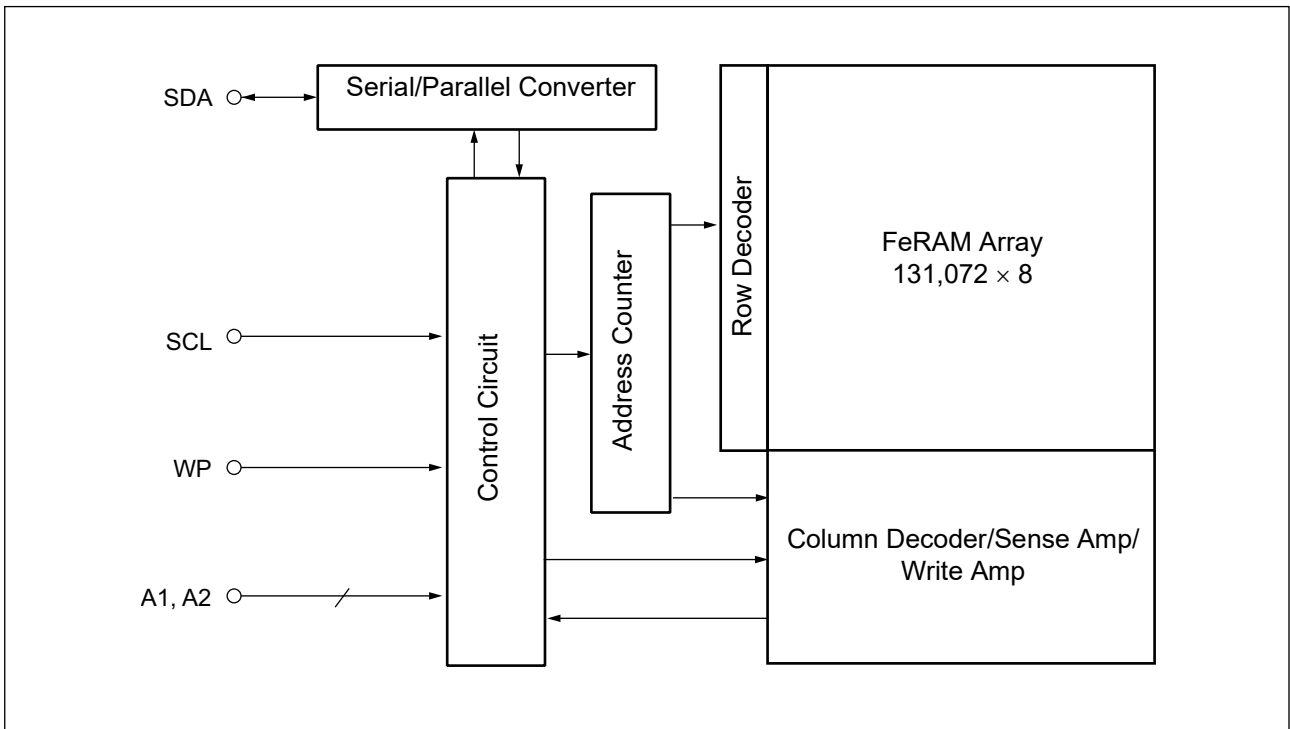

■ PIN ASSIGNMENT

■ PIN FUNCTIONAL DESCRIPTIONS

Pin Number	Pin Name	Functional Description
1	NC	Not used. Floating or connect to VDD or VSS.
2 to 3	A1 to A2	Device Address pins The MS85RC1MTY can be connected to the same data bus up to 8 devices. Device addresses are used in order to identify each of these devices. Connect these pins to VDD pin or VSS pin externally. Only if the combination of VDD and VSS pins matches Device Address Code inputted from the SDA pin, the device operates. In the open pin state, A1 and A2 pins are internally pulled-down and recognized as the "L" level.
4	VSS	Ground pin
5	SDA	Serial Data I/O pin This is an I/O pin which performs bidirectional communication for both memory address and writing/reading data. It is possible to connect multiple devices. It is an open drain output, so a pull-up resistor is required to be connected to the external circuit.
6	SCL	Serial Clock pin This is a clock input pin for input/output serial data. Data is sampled on the rising edge of the clock and output on the falling edge.
7	WP	Write Protect pin When the Write Protect pin is the "H" level, the writing operation is disabled. When the Write Protect pin is the "L" level, the entire memory region can be overwritten. The reading operation is always enabled regardless of the Write Protect pin input level. The Write Protect pin is internally pulled down to VSS pin, and that is recognized as the "L" level (write enabled) when the pin is the open state.
8	VDD	Supply Voltage pin

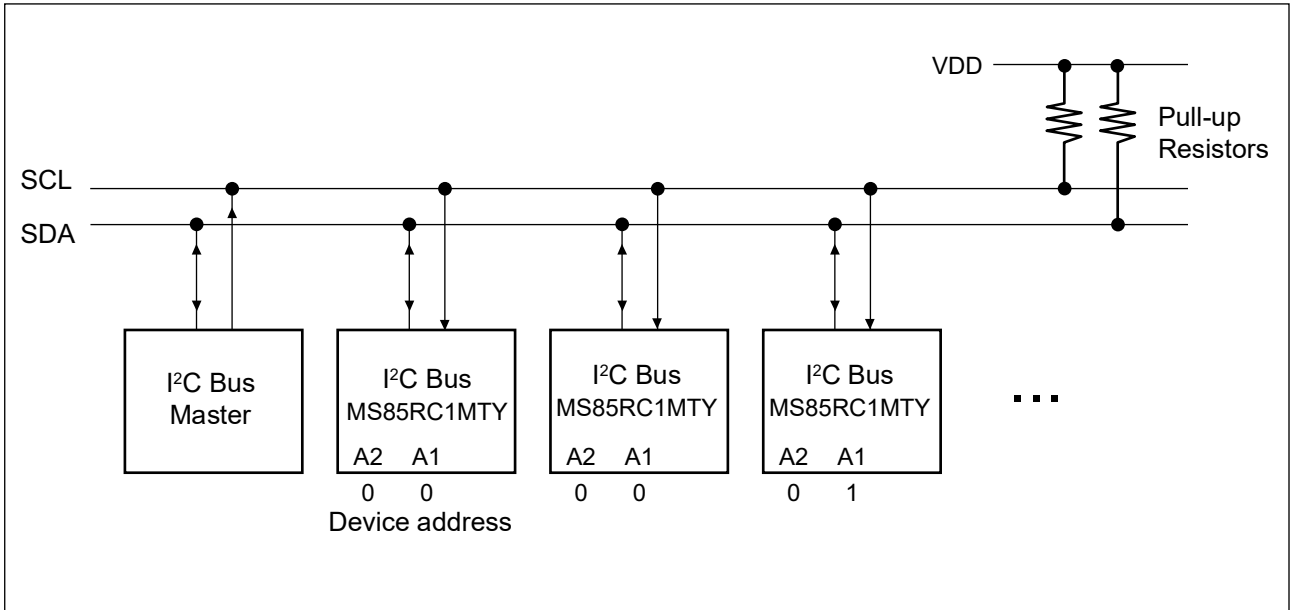

■ BLOCK DIAGRAM

■ I²C (Inter-Integrated Circuit)

The MS85RC1MTY has the two-wire serial interface; the I²C bus, and operates as a slave device. The I²C bus defines communication roles of “master” and “slave” devices, with the master side holding the authority to initiate control. Furthermore, the I²C bus connection is possible where a single master device is connected to multiple slave devices in a party-line configuration. In this case, it is necessary to assign a unique device address to the slave device, the master side starts communication after specifying the slave to communicate by addresses.

● I²C Interface System Configuration Example

■ I²C COMMUNICATION PROTOCOL

The I²C bus is a two wire serial interface that uses a bidirectional data bus (SDA) and serial clock (SCL). A data transfer can only be initiated by the master, which will also provide the serial clock for synchronization. The SDA signal should change while the SCL is the "L" level. However, as an exception, when starting and stopping communication sequence, the SDA is allowed to change while the SCL is the "H" level.

- Start Condition

To start read or write operations by the I²C bus, change the SDA input from the "H" level to the "L" level while the SCL input is in the "H" level.

- Stop Condition

To stop the I²C bus communication, change the SDA input from the "L" level to the "H" level while the SCL input is in the "H" level. In the reading operation, inputting the stop condition finishes reading and enters the standby state. In the writing operation, inputting the stop condition finishes inputting the rewrite data and enters the standby state.

- Start Condition, Stop Condition

Note : At the write operation, the FeRAM device does not need the programming wait time (t_{wc}) after issuing the Stop Condition.

■ ACKNOWLEDGE (ACK)

In the I²C bus, serial data including memory address or memory information is sent and received in units of 8 bits. The acknowledge signal indicates that every 8 bits of the data is successfully sent and received. The receiver side usually outputs the "L" level every time on the 9th SCL clock after each 8 bits are successfully transmitted and received. On the transmitter side, the bus is temporarily released to Hi-Z every time on this 9th clock to allow the acknowledge signal to be received and checked. During this Hi-Z released period, the receiver side pulls the SDA line down to indicate the "L" level that the previous 8 bits communication is successfully received.

In case the slave side receives Stop condition before sending or receiving the ACK "L" level, the slave side stops the operation and enters to the standby state. On the other hand, the slave side releases the bus state after sending or receiving the NACK "H" level. The master side generates Stop condition or Start condition in this released bus state.

- Acknowledge timing overview diagram

■ **DEVICE ADDRESS WORD (Slave address)**

Following the start condition, the master inputs the 8 bits device address word to start I²C communication. The device address word (8 bits) consists of a device Type code (4 bits), device address code (2 bits), MSB(1bit) and a read/write code (1 bit).

- Device Type Code (4 bits)

The upper 4 bits of the device address word are a device type code that identifies the device type, and are fixed at “1010” for the MS85RC1MTY.

- Device Address Code (2 bits)

Following the device type code, the 2 bits of the device address code are input in order of A2 and A1. The device address code identifies one device from up to four devices connected to the bus. Each MS85RC1MTY is given a unique 2 bits code on the device address pin (external hardware pin A2 and A1). The slave only responds if the received device address code is equal to this unique 3 bits code.

- The most significant address(1 bit)

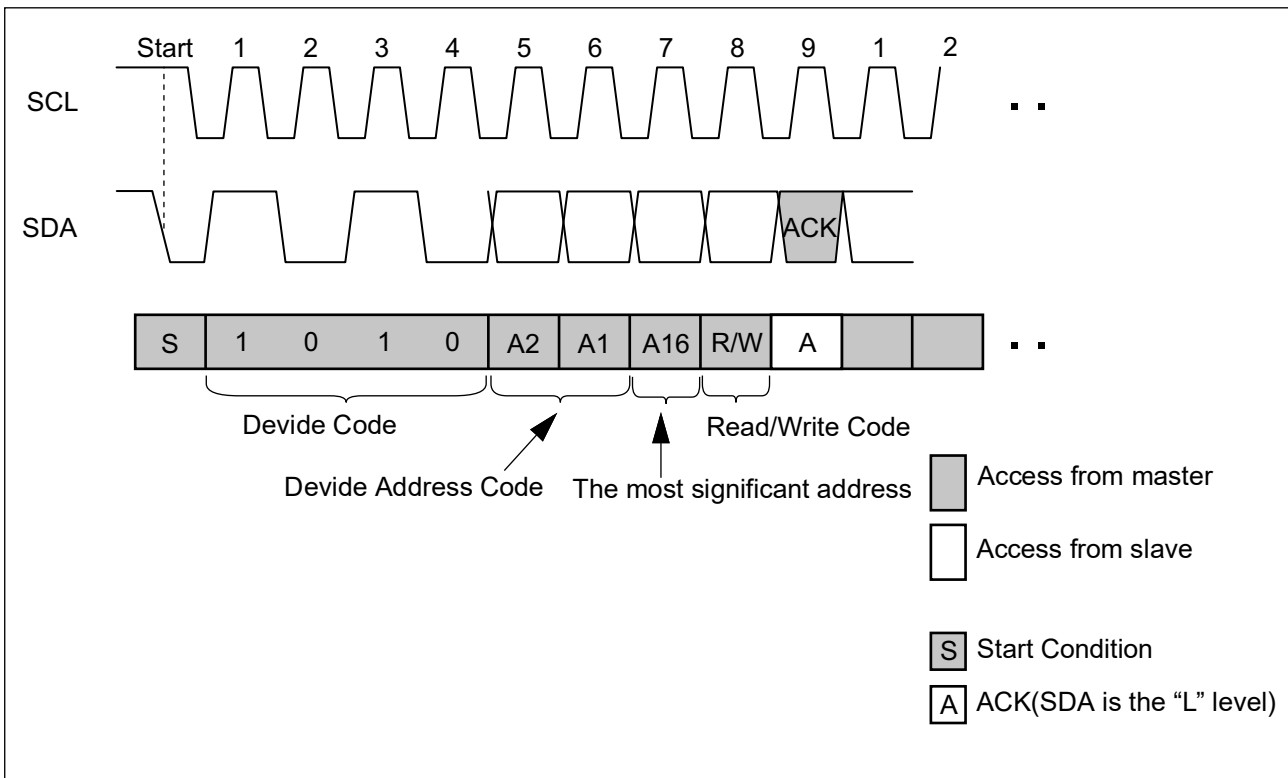

The seventh bit of device address word is A16(1 bit) that is the most significant address.

- Read/Write Code (1 bit)

The 8th bit of the device address word is the R/W (read/write) code. When the R/W code is “0”, a write operation is enabled, and the R/W code is “1”, a read operation is enabled for the MS85RC1MTY.

It turns to a stand-by state if the device code is not “1010” or device address code does not equal to pin A2, A1 and A0.

● **Device Address Word**

■ DATA STRUCTURE

In the I²C bus, the acknowledge “L” level is output on the 9th bit by a slave, after the 8 bits of the device address word following the start condition are input by a master. After confirming the acknowledge response by the master, the master outputs remained 8 bits × 2 memory address to the slave. When the each memory address input ends, the slave again outputs the acknowledge “L” level. After this operation, the I/O data follows in units of 8 bits, with the acknowledge “L” level output after every 8 bits.

It is determined by the R/W code whether the data line is driven by the master or the slave. However, the clock line shall be driven by the master. For a write operation, the slave will accept 8 bits from the master, then send an acknowledge. If the master detects the acknowledge, the master will transfer the next 8 bits. For a read operation, the slave will place 8 bits on the data line, then wait for an acknowledge from the master.

■ FeRAM ACKNOWLEDGE -- POLLING NOT REQUIRED

The MS85RC1MTY performs the high speed write operations, so any waiting time for an ACK polling* does not occur.

*: In E²PROM, the Acknowledge Polling is performed as a progress check whether rewriting is executed or not. It is normal to judge by the 9th bit of Acknowledge whether rewriting is performed or not after inputting the start condition and then the device address word (8 bits) during rewriting.

■ WRITE PROTECT (WP)

The entire memory array can be write protected using the Write Protect pin. When the Write Protect pin is set to the “H” level, the entire memory array will be write protected. When the Write Protect pin is the “L” level, the entire memory array will be rewritten. Reading is allowed regardless of the WP pin's “H” level or “L” level.

Note : The Write Protect pin is pulled down internally to the VSS pin, therefore if the Write Protect pin is open, the pin status is detected as the “L” level (write enabled).

■ COMMAND

• Byte Write

If the device address word (R/W “0” input) is sent following the start condition, the slave responds with an ACK. After this ACK, write addresses and data are sent in the same way, and the write ends by generating a stop condition at the end.

• Page Write

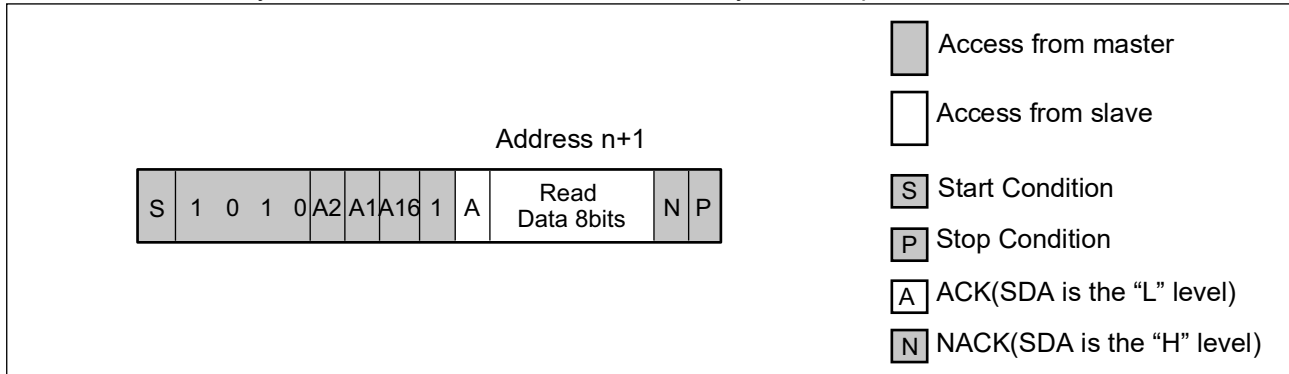

If additional 8 bits are continuously sent after the same command (except stop condition) as Byte Write, a page write is performed. The memory address rolls over to first memory address (0 0000_H) at the end of the address. Therefore, if more than 128K bytes are sent, the data is overwritten in order starting from the start of the memory address that was written first. Because FeRAM performs the high-speed write operations, the data will be written to FeRAM right after the ACK response finished.

Note: It is not necessary to take a period for internal write operation cycles from the buffer to the memory after the stop condition is generated.

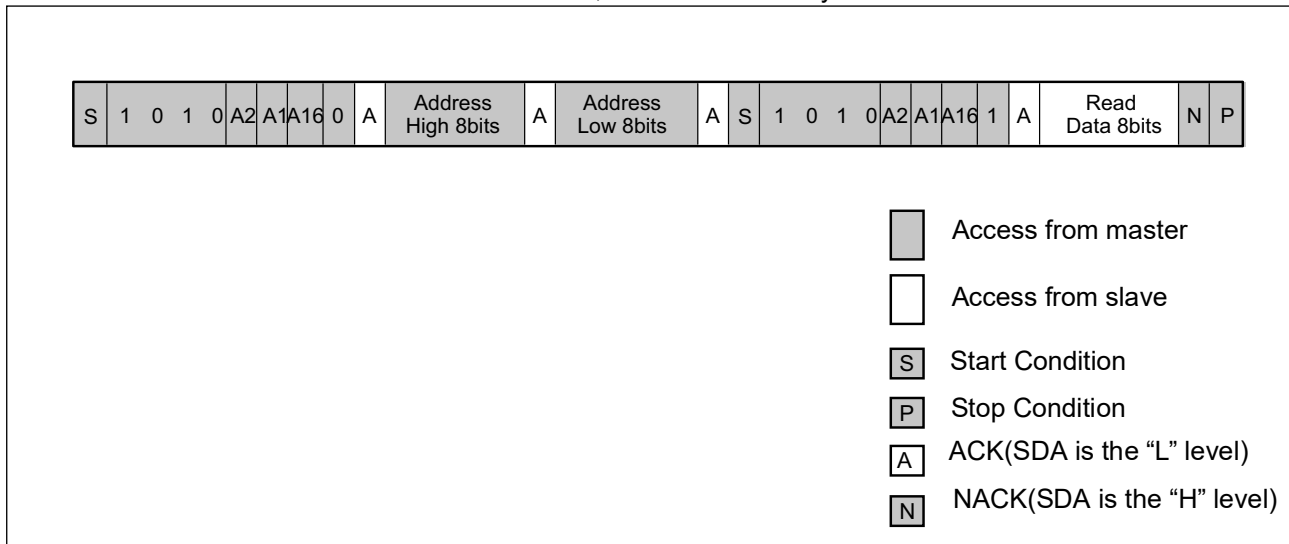

• Current Address Read

When the previous write or read operation finishes successfully up to the stop condition, the memory address accessed last time is remain in memory address buffer(17bits). As it is, then send the command without turning off the power, the memory address "n", total 17 bits consist of the 1 bit of the top memory address from the Device Address Word input and lower 16 bits of memory address buffer, is read from the address "n+1". If the memory address "n" is last address, the address counter will roll over to (0000H). The current address in memory address buffer is undefined immediately after the power is turned on.

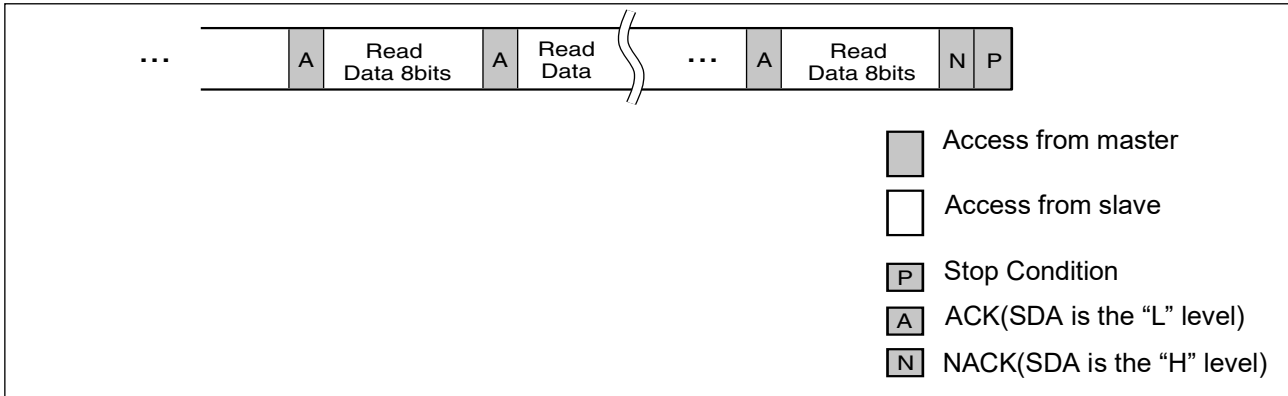

• Random Read

The one byte of data from the memory address saved in the memory address buffer can be read out synchronously to SCL by specifying the address in the same way as for a write, and then issuing another start condition and sending the Device Address Word (R/W "1" input). The top address input at second time need to same value as top address inputed first time. If input the different value at first time and second time, the second value is reflected as the address to access. The final NACK (SDA is the "H" level) is issued by the receiver that receives the data. In this case, this bit is issued by the master side.

• Sequential Read

Data can be received continuously following the Device address word (R/W “1” input) after specifying the address in the same way as for Random Read. If the read reaches the end of address, the internal read address automatically rolls over to first memory address (0 0000H) and keeps reading.

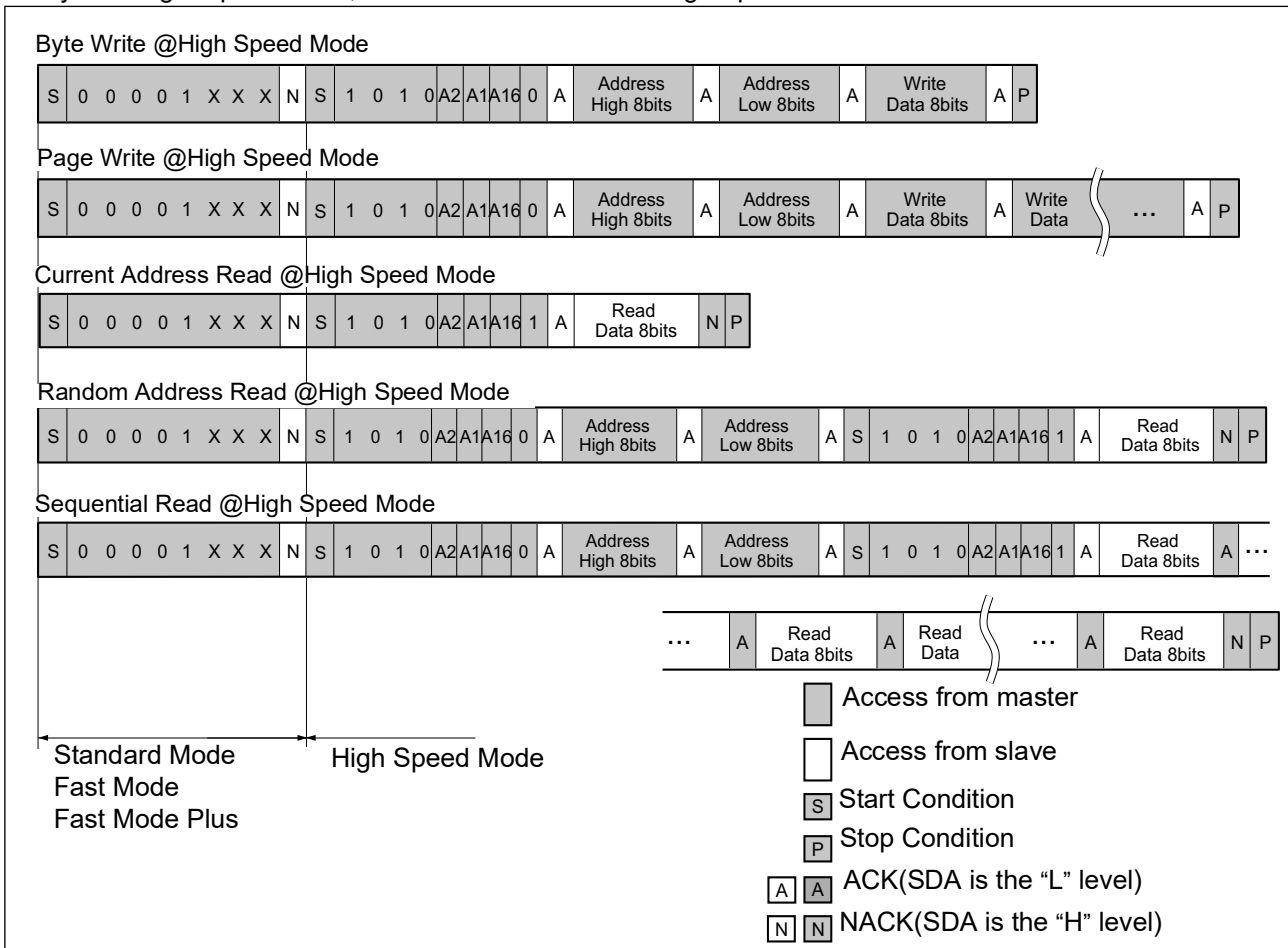

• High Speed Mode

MS85RC1MTY supports High Speed mode up to 3.4 MHz. By sending an entry command (0000 1XXX) after start condition from the master side, it informs to the slave that the data transmission with High Speed mode will start.

Since there is no slave side which is allowed to respond to this entry command, NACK response continues from the slave side. After the master side recognizes this NACK response, the master side changes its state to High Speed mode and enables the bidirectional communication up to 3.4 MHz.

By sending Stop condition, it exits out of the state in High Speed communication.

• Sleep Mode

MS85RC1MTY provides Sleep mode which reduces less current consumption than Standby mode, by stooping the internal regulator circuits. Following sequences enable the Sleep mode transition.

<Transition to Sleep mode>

- a) The master sends start condition followed by F8h.
- b) After ACK response from slave, the master sends the device address word.
In this device address word, Read/Write code is Don't care.
- c) After ACK response from slave, the master re-sends the start condition followed by 86h.
- d) The slave moves to Sleep mode after ACK response to the master.

Even if the MS85RC1MTY stays in the Sleep mode, SDA and SCL signals are monitored. Following sequences enable the transition to Standby mode after recovery time (t_{REC}) of internal regulator circuits.

<Exit from Sleep mode>

- a) The master sends start condition followed by device address word.
In this device address word, Read/Write code is Don't care.
- b) At the rising edge of 9th clock from start condition, an internal regulator starts to operate its recovery sequence.
- c) After the recovery time (t_{REC}) passed, standby mode enabled.

After returning to Standby mode, reading and writing are enabled by sending each command starts with start condition.

• Device ID

The Device ID command reads fixed Device ID. The size of Device ID is 3 bytes and consists of manufacturer ID and product ID. The Device ID is read-only and can be read out by following sequences.

- a) The master sends the Reserved Slave ID F8_H after the START condition.
- b) The master sends the device address word after the ACK response from the slave.
In this device address word, R/W code is "Don't care".
- c) The master re-sends the START condition followed by the Reserved Slave ID F9_H after the ACK response from the slave.
- d) The master read out the Device ID succeedingly in order of Data Byte 1st / 2nd / 3rd after the ACK response from the slave.
- e) The master responds the NACK (SDA is the "H" level) after reading 3 bytes of the Device ID.
In case the master respond the ACK after reading 3 bytes of the Device ID, the master re-reading the Device ID from the 1st byte.

- Access from master
- Access from slave
- S** Start Condition
- P** Stop Condition
- A** ACK (SDA is the "L" level)
- N** NACK (SDA is the "H" level)

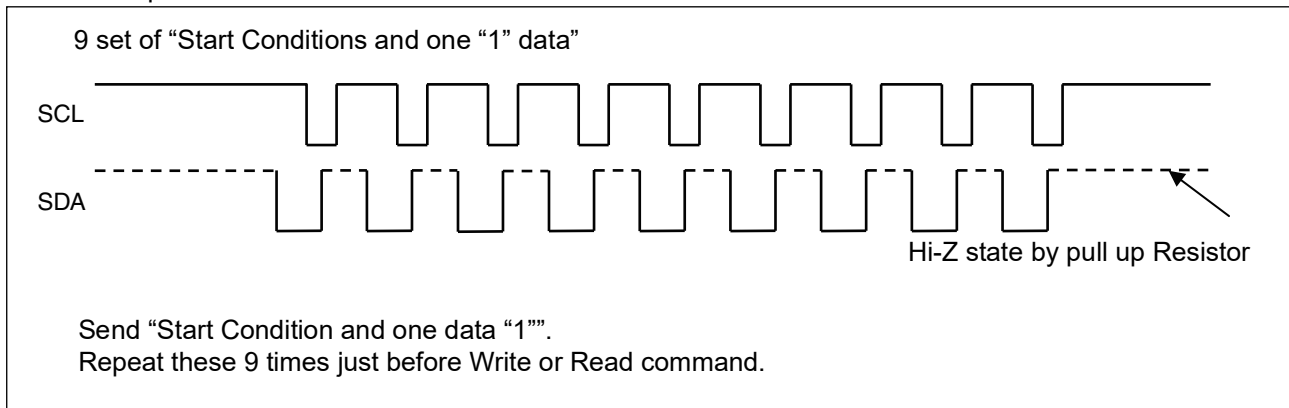

Data Byte 1st										Data Byte 2nd										Data Byte 3rd																
Manufacture ID = 00A _H										Product ID = 598 _H																										
11	10	9	8	7	6	5	4	3	2	1	0	11	10	9	8	7	6	5	4	3	2	1	0	11	10	9	8	7	6	5	4	3	2	1	0	
										Density = 7 _H					Proprietary use																					
0	0	0	0	0	0	0	0	0	1	0	1	0	0	1	1	1	1	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

■ SOFTWARE RESET SEQUENCE OR COMMAND RETRY

In case the malfunction has occurred after power on, the master side stopped the I²C communication during processing, or unexpected malfunction has occurred, execute the following (1) software recovery sequence just before each command, or (2) retry command just after failure of each command.

(1) Software Reset Sequence

Since the slave side may be outputting "L" level, do not force to drive "H" level, when the master side drives the SDA port. This is for preventing a bus conflict. The additional hardware is not necessary for this software reset sequence.

(2) Command Retry

Command retry is useful to recover from failure response during I²C communication.

■ ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Rating		Unit
		Min	Max	
Power supply voltage*	V_{DD}	- 0.5	+4.0	V
Input voltage*	V_{IN}	- 0.5	$V_{DD} + 0.5 (\leq 4.0)$	V
Output voltage*	V_{OUT}	- 0.5	$V_{DD} + 0.5 (\leq 4.0)$	V
Operation ambient temperature	T_A	- 40	+ 125	°C
Storage temperature	T_{stg}	- 55	+ 125	°C

*: These parameters are based on the condition that VSS is 0 V.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

■ RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Value			Unit
		Min	Typ	Max	
Power supply voltage* ¹	V_{DD}	1.8	3.3	3.6	V
Operation ambient temperature* ²	T_A	- 40	—	+ 125	°C

*1: These parameters are based on the condition that VSS is 0 V.

*2: Ambient temperature when only this device is working. Please consider it to be the almost same as the package surface temperature.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

■ ELECTRICAL CHARACTERISTICS

1. DC Characteristics

(within recommended operating conditions)

Parameter	Symbol	Condition	Value			Unit
			Min	Typ (T _A =25 °C)	Max	
Input leakage current*1	I _{LI}	V _{IN} = 0 V to V _{DD}	—	—	1	μA
Output leakage current*2	I _{LO}	V _{OUT} = 0 V to V _{DD}	—	—	1	μA
Operating power supply current	I _{DD}	SCL = 0.1 MHz	—	—	—	mA
		SCL = 1 MHz	—	0.09	0.25	mA
		SCL = 3.4 MHz	—	0.24	0.4	mA
Standby current	I _{SB}	SCL, SDA = V _{DD} A1, A2, WP = 0 V or Open Under Stop Condition	—	12	150	μA
Sleep current	I _{ZZ}	SCL, SDA = V _{DD} A1, A2, WP = 0 V	—	0.3	16	μA
“H” level input voltage	V _{IH}	V _{DD} = 1.8 V to 3.6 V	V _{DD} × 0.8	—	V _{DD} + 0.5	V
“L” level input voltage	V _{IL}	V _{DD} = 1.8 V to 3.6 V	-0.5	—	V _{DD} × 0.2	V
“L” level output voltage	V _{OL}	I _{OL} = 3 mA	—	—	0.4	V
Input resistance for WP, A1 and A2 pins	R _{IN}	—	11	33	125	kΩ

*1: Applicable pin: SCL, SDA

*2: Applicable pin: SDA

2. AC Characteristics

Parameter	Symbol	Value								Unit
		STANDARD MODE		FAST MODE		FAST MODE PLUS		HIGH SPEED MODE		
		Min	Max	Min	Max	Min	Max	Min	Max	
SCL clock frequency	F _{SCL}	0	100	0	400	0	1000	0	3400	kHz
Clock high time	T _{HIGH}	4000	—	600	—	260	—	60	—	ns
Clock low time	T _{LOW}	4700	—	1300	—	500	—	160	—	ns
SCL/SDA rising time	T _r	—	1000	—	300	—	300	—	80	ns
SCL/SDA falling time	T _f	—	300	—	300	—	120	—	80	ns
Start condition hold	T _{HD:STA}	4000	—	600	—	250	—	160	—	ns
Start condition setup	T _{SU:STA}	4700	—	600	—	250	—	160	—	ns
SDA input hold	T _{HD:DAT}	0	—	0	—	0	—	0	—	ns
SDA input setup	T _{SU:DAT}	250	—	100	—	50	—	10	—	ns
SDA output hold	T _{DH:DAT}	0	—	0	—	0	—	0	—	ns
Stop condition setup	T _{SU:STO}	4000	—	600	—	250	—	160	—	ns
SDA output access after SCL falling	T _{AA}	—	3000	—	900	—	450	—	130	ns
Pre-charge time	T _{BUF}	4700	—	1300	—	500	—	300	—	ns
Noise suppression time (SCL and SDA)	T _{SP}	—	50	—	50	—	50	—	10	ns

AC characteristics were measured under the following measurement conditions.

- Power supply voltage : 1.8 V to 3.6 V
- Operation ambient temperature : - 40 °C to + 125 °C
- Input voltage magnitude : $V_{DD} \times 0.2$ to $V_{DD} \times 0.8$
- Input rising time : 5 ns
- Input falling time : 5 ns
- Input judge level : $V_{DD}/2$
- Output judge level : $V_{DD}/2$
- Output load capacitance : 100 pF

3. AC Timing Definitions

4. Pin Capacitance

Parameter	Symbol	Conditions	Value			Unit
			Min	Typ	Max	
I/O capacitance	$C_{I/O}$	$V_{DD} = 3.3 V,$ $f = 1 MHz, T_A = + 25 ^\circ C$	—	—	8	pF
Input capacitance	C_{IN}		—	—	8	pF

5. AC Test Load Circuit

■ POWER ON/OFF SEQUENCE

When applying relatively short term V_{DD} pulse whose peak is more than 1.7V, it is required to set falling time, t_f more than 0.4ms/V. (In case V_{DD} rises over 1.7V and falls just after that, if this term is short, device may lose its function.)

Parameter	Symbol	Value		Unit
		Min	Max	
SDA, SCL level hold time during power down	t_{pd}	85	—	ns
SDA, SCL level hold time during power up	t_{pu}	450	—	μs
Power supply rising time	t_r	0.05	—	ms/V
Power supply falling time	t_f	0.1	—	ms/V
Internal regulator recovery time	t_{REC}	—	450	μs

If the device does not operate within the specified conditions of read cycle, write cycle or power on/off sequence, memory data can not be guaranteed.

■ FeRAM CHARACTERISTICS

Item	Min	Max	Unit	Parameter
Read/Write Endurance*1	10^{13}	—	Times	Operation Ambient Temperature $T_A = +125\text{ }^\circ\text{C}$
	10^{14}	—		Operation Ambient Temperature $T_A = +85\text{ }^\circ\text{C}$
Data Retention*2	5.9^{*3}	—	Years	Operation Ambient Temperature $T_A = +125\text{ }^\circ\text{C}$
	19.1	—		Operation Ambient Temperature $T_A = +105\text{ }^\circ\text{C}$
	70.4	—		Operation Ambient Temperature $T_A = +85\text{ }^\circ\text{C}$

*1 : The value for Read/Write endurance apply to the total number of read and write operations per row in FeRAM. This is because FeRAM needs writing operation after each reading operations.

*2 : Minimum values define retention time of the first reading/writing data right after shipment.

*3 : Under evaluation for more than 5.9 years(+125 °C).
These values are calculated by qualification results.

■ NOTE ON USE

- We recommend programming of the device after reflow. Data written before reflow cannot be guaranteed.
- During the access period from the start condition to the stop condition, keep the level of WP, A0, A1 and A2 pins to the “H” level or the “L” level.

■ ESD AND LATCH-UP

Test	DUT	Value
ESD HBM (Human Body Model) JEDEC JS001 compliant	MS85RC1MTYPNF-G-BDE1 MS85RC1MTYPNF-G-BDERE1 MS85RC1MTYPN-G-AWE1 MS85RC1MTYPN-G-AWEWE1	$\geq 2000\text{ V} $

Label II: Moisture Barrier Bag (It sticks it on the Aluminum laminated bag)
 [MSL Label]

 <p>Caution This bag contains MOISTURE-SENSITIVE DEVICES</p> <p>1. Calculated shelf life in sealed bag: 24 months at <40°C and <90% relative humidity (RH)</p> <p>2. Peak package body temperature: 260°C</p> <p>3. After bag is opened, devices that will be subjected to reflow solder or other high temperature process must be</p> <p>a) Mounted within: 168 hours of factory conditions <30°C/60% RH, or</p> <p>b) Stored per J-STD-033</p> <p>4. Devices require bake, before mounting, if:</p> <p>a) Humidity Indicator Card reads >10% for level 2a - 5a devices or >60% for level 2 devices when read at 23 ± 5°C</p> <p>b) 3a or 3b are not met</p> <p>5. If baking is required, refer to IPC/JEDEC J-STD-033 for bake procedure</p> <p>Bag Seal Date: see adjacent bar code label.</p> <p>Note: Level and body temperature defined by IPC/JEDEC J-STD-020</p>	<p>LEVEL</p> <p>3</p> <p>← MSL label</p>

All Rights Reserved.

RAMXEED LIMITED, its subsidiaries and affiliates (collectively, "RAMXEED ") reserves the right to make changes to the information contained in this document without notice. Please contact your RAMXEED sales representatives before order of RAMXEED device.

Information contained in this document, such as descriptions of function and application circuit examples is presented solely for reference to examples of operations and uses of RAMXEED device. RAMXEED disclaims any and all warranties of any kind, whether express or implied, related to such information, including, without limitation, quality, accuracy, performance, proper operation of the device or non-infringement. If you develop equipment or product incorporating the RAMXEED device based on such information, you must assume any responsibility or liability arising out of or in connection with such information or any use thereof. RAMXEED assumes no responsibility or liability for any damages whatsoever arising out of or in connection with such information or any use thereof.

Nothing contained in this document shall be construed as granting or conferring any right under any patents, copyrights, or any other intellectual property rights of RAMXEED or any third party by license or otherwise, express or implied. RAMXEED assumes no responsibility or liability for any infringement of any intellectual property rights or other rights of third parties resulting from or in connection with the information contained herein or use thereof.

The products described in this document are designed, developed and manufactured as contemplated for general use including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high levels of safety is secured, could lead directly to death, personal injury, severe physical damage or other loss (including, without limitation, use in nuclear facility, aircraft flight control system, air traffic control system, mass transport control system, medical life support system and military application), or (2) for use requiring extremely high level of reliability (including, without limitation, submersible repeater and artificial satellite). RAMXEED shall not be liable for you and/or any third party for any claims or damages arising out of or in connection with above-mentioned uses of the products.

Any semiconductor devices fail or malfunction with some probability. You are responsible for providing adequate designs and safeguards against injury, damage or loss from such failures or malfunctions, by incorporating safety design measures into your facility, equipments and products such as redundancy, fire protection, and prevention of overcurrent levels and other abnormal operating conditions.

The products and technical information described in this document are subject to the Foreign Exchange and Foreign Trade Control Law of Japan, and may be subject to export or import laws or regulations in U.S. or other countries. You are responsible for ensuring compliance with such laws and regulations relating to export or re-export of the products and technical information described herein.

All company names, brand names and trademarks herein are property of their respective owners.
